

Crack Sealing

Crack Sealing – Crack sealing asphalt pavement cracks is a common preventive maintenance treatment. Pavement cracks can extend longitudinally and transversely across the roadway. They are caused by thermal stress and/or traffic loading. Crack sealing is a key element in early intervention as it slows the deterioration process and can significantly add 2 to 8 years of life to the pavement.

Construction process:

1. Street cracks will be cleared of vegetation and debris.
2. The cracks will then be filled/sealed with a crack sealant to prevent water intrusion.
